The evidence

Treatment Burden

- The “work” of chronic disease self-management
- Increasing because of:
 - Changing demographics
 - Multimorbidity
 - Polypharmacy
 - Fragmentation
 - Increasing Specialisation

Courtesy of BMJ 29 august 2009 Vol 339. May, Montori, Mair. We need Minimally Disruptive Medicine.

Improvement potential

- Treatment Burden should become a barometer of quality of care for GP clusters
- Patient centred rather than disease centred care should be promoted - targets set locally should relate to overall wellbeing rather than just individual disease markers.
- The use of new measures such as the Patient Experience with Treatment and Self-management (PETS): a patient-reported measure of treatment burden should be tested
- GP clusters have the ability to reduce treatment burden through improving care co-ordination, information provision and better 'signposting'.
